Geographically Weighted Regression A Method

Abstract. Spatial nonstationarity is a condition in which a simple "global" model cannot explain the relationships between some sets of variables. The nature of the model must alter over space to reflect the structure within the data. In this paper, a technique is developed, termed geographically weighted regression, which attempts to capture this variation by calibrating a multiple regression model which allows different relationships to exist at different points in space.

Geographically Weighted Regression: A Method for Exploring ...

Geographically weighted regression (GWR) is a local form of spatial analysis introduced in 1996 in the geographical literature drawing from statistical approaches for curve-fitting and smoothing applications. The method works based on the simple yet powerful idea of estimating local models using subsets of observations centered on a focal point.

This tool performs Geographically Weighted Regression (GWR), a local form of regression used to model spatially varying relationships. The GWR tool provides a local model of the variable or process you are trying to understand or predict by fitting a regression equation to every feature in the dataset.

Geographically Weighted Regression (GWR) is one of several spatial regression techniques used in geography and other disciplines. GWR evaluates a local model of the variable or process you are trying to understand or predict by fitting a regression equation to every feature in the dataset.

How Geographically Weighted Regression (GWR) works—ArcGIS ...

In this study, we selected two geographically weighted regression

methods (namely GWR and MGWR) and four weighting functions (i.e. TH, DIS, GAU, and BI). The combination of two regression methods and four weighting functions leads to eight merging algorithms: GWR-TH, GWR-DIS, GWR-GAU, GWR-BI, MGWR-TH, MGWR-DIS, MGWR-GAU, and MGWR-BI.

Geographically weighted regression and the expansion method are two statistical techniques which can be used to examine the spatial variability of regression results across a region and so inform on the presence of spatial nonstationarity.

Linear regression methods, like GWR, are not appropriate for predicting binary outcomes (e.g., all of the values for the dependent variable are either 1 or 0). In global regression models, such as Ordinary Least Squares Regression (OLS), results are unreliable when two or more variables exhibit multicollinearity (when two or more variables are redundant or together tell the same "story").

In this paper, we demonstrate use of the geographically weighted regression (GWR) method to account for spatial heterogeneity. In GWR, local models are reported in which association varies according to the location accounting for the local variation in variables.

Geographically Weighted Regression Analysis: A Statistical ... Geographically weighted regression

(GWR) is a local version of spatial regression that generates parameters disaggregated by the spatial units of analysis. This allows assessment of the spatial heterogeneity in the estimated relationships between the independent and dependent variables.

Spatial analysis - Wikipedia

The essence of geographically weighted regression is that it allows different relationships between the dependent and independent variables to exist at different points, (x,y) , in space. For a full discussion of this method see Brunsdon et al. (1996).

Large variability and correlations among the coefficients obtained from the method of geographically weighted regression (GWR) have been identified in previous research.
