Uniform Circular Motion. The Uniform Circular Motion Interactive provides the learner with an interactive, variable-rich environment for exploring principles and relationships related to moving in a circle at a constant speed. Learners can manipulate the radius of the circle, the speed of the object and the mass of the object and investigate the effect upon the acceleration and net force.

restoring force on a string. In this experiment the tension in a string will act as the centripetal force on an object. THEORY: When a body moves with a constant speed in a circular path, it is said to move with uniform circular motion. Although the speed of the object is constant, the direction of the motion is continually changing.

Lab 7: Uniform Circular Motion - Houston Community College

Since the velocity vector is changing in time, the object in uniform circular motion is accelerating. Conceptually, using parallel and perpendicular coordinates is convenient because the parallel force is responsible for changes in speed and the perpendicular force (or centripetal force) is responsible for changes in direction.

5.1 Uniform Circular Motion Example 1: A Tire-Balancing Machine The wheel of a car has a radius of 0.29m and it being rotated at 830 revolutions per minute on a tire-balancing machine. Determine the speed at which the outer edge of the wheel is moving. $1.210 \text{ min} \times \frac{1 \text{ revolution}}{830 \text{ revolutions}} = 1.41 \times 10^{-3} \text{ min} = 0.072 \text{ s}$ $2\pi \times 0.29 \text{ m} = 1.82 \text{ m}$ $v = \frac{1.82 \text{ m}}{0.072 \text{ s}} = 25.3 \text{ m/s}$

Chapter 5

An object undergoing uniform circular motion is moving with a constant speed. Nonetheless, it is accelerating due to its change in direction. The direction of the acceleration is inwards. The animation at the right depicts this by means of a vector arrow. The final motion characteristic for an object undergoing uniform circular motion is the net force.

6. An open area to conduct the experiment. (Hallway or Classroom) Procedure: 1. Gather the materials to conduct the experiment. Choose an object and measure its mass. 2. Find a safe area to conduct the experiment. Safe = far enough away from other groups so that no students impede the motion of the object. 3. Securely tie the object onto a string.

CIRCULAR MOTION EXPERIMENT - MYP PHYSICS

Uniform circular motion is the motion of a particle along a circular path with constant speed. It is accelerated motion; although speed is constant, velocity changes as direction changes. c) Recall and use $v = r\omega$ to solve problems Linear velocity, v , of an object is its instantaneous velocity at any point in its circular path.

Motion in a circle | A Level Physics Notes | GCE Guide

The acceleration of an object moving in uniform circular motion is $a = v^2/r$, so the magnitude of the centripetal force of an object with a mass (m) that is moving with a velocity (v) in a circular orbit of radius (r) can be found from The distance (circumference) around a circle is $2\pi r$. The velocity of an object moving in a
