Thrust and torque were measured over a range of propeller advance ratios for discrete propeller speeds (RPM's) - typically four different values of RPM to examine low Reynolds number effects. Also static thrust was measured over a range of propeller speeds from nominally 1500 to 7500 RPM depending on the propeller diameter.

Lowering the pitch will increase rpm and vice versa. For example, going from a 23-pitch to a 21-pitch propeller will increase engine rpm by about 400 revolutions. The trick is to choose a boat propeller that delivers acceptable acceleration and top speed.

Wind tunnel tests were carried out on a scaled model of the propeller comparing actual performance against theoretical predictions. The design method was shown to be capable of producing a propeller design that could provide sufficient thrust over a large range of advance ratios (0.12 to 0.4) and altitudes (0 to 15 000 m).

Propeller efficiencies varied greatly from a peak near 0.65 (for an efficient pr opeller) to near 0.28 (for an exceptionally poor propeller). Thus, these results indicate that proper propeller selection for UAVs can have a dramatic effect on aircraft performance.

Propeller Performance Measurement For Low Reynolds Number
If the propeller pitch is too low (lower in inches) the engine can run over the desired WOT RPM which can lead to engine damage, or to the engine protecting itself with a rev limiter. If the prop pitch is too high (higher in inches) the motor may run below the WOT range—called “lugging the engine”—which can also put undue stress on engine and gearcase components.

Understanding Propeller Pitch | Discover Boating
the fact that at low airspeeds, propeller efficiency is very low. As airspeed increases, so does efficiency, quickly at first, then more slowly, up to its maximum (about 85-87%), and then falls off beyond the peak That trend is also shown by the outline of the Maximum Efficiency Envelope in Figure 1.

Propeller Performance: An introduction, by EPI Inc.
While much research has been carried out on propellers for full-scale aircraft, not much data exists on propellers applicable to the ever growing number of UAVs. Many of these UAVs use propellers that must operate in the low Reynolds number range of 50,000 to 100,000 based on the propeller chord at the 75% propeller-blade station.

In practice, the propulsive efficiency typically peaks at a level of around 0.8 for a propeller before various aerodynamic effects act to decay its performance as will be shown in the following section.
