Dynamic contrast-enhanced MRI assessment of tumor-induced lymph flow could complement other MRI strategies being developed for cancer diagnosis, such as analysis of LN uptake of iron nanoparticles in macrophages or iron nanoparticle labeling of tumor cells in mice .Magnetic resonance imaging lymphography may also be useful for the analysis of experimental lymphedema or lymphatic malformations in mice . Thus, the MRI lymphography assay we have developed should allow detailed anatomic and ...

Conventional breast MRI protocols implement the dynamic contrast enhanced (DCE) MRI together with high spatial resolution gadolinium enhanced MRI. Use of such protocols results in high sensitivity and somewhat lower specificity for identification and characterization of focal breast lesions (1-9). DCE MRI yields a time intensity curve (kinetic curve) that is commonly used in clinical settings.

Semiquantitative Dynamic Contrast-Enhanced Magnetic Resonance Imaging DCE-MRI is an umbrella term used to describe a wide variety of dynamic MRI techniques and analytic approaches, including both qualitative and quantitative methods. 23 Common to all approaches is the serial acquisition of heavily T1-weighted images before and after the injection of the paramagnetic contrast agent.

Dynamic contrast-enhanced MRI has been routinely used for detection and diagnosis of the tumor, for staging and monitoring the therapeutic response, as well as for guiding targeted biopsies in patients with suspected prostate cancer or with a negative biopsy result.

Dynamic Contrast-Enhanced Magnetic Resonance Imaging in ...

In Dynamic susceptibility contrast MR imaging (DSC-MRI, or simply DSC), Gadolinium contrast agent (Gd) is injected (usually intravenously) and a time series of fast T2*-weighted images is acquired. As Gadolinium passes through the tissues, it induces a reduction of T2* in the nearby water protons; the corresponding

decrease in signal intensity observed depends on the local Gd concentration, which may be considered a proxy for perfusion.

For breast cancer, contrast-enhanced breast magnetic resonance imaging (MRI) is a good imaging modality to depict tumor angiogenesis because the contrast enhancement pattern of the tumor correlates with microvessel density characteristic of tumor angiogenesis. [4,5] In addition, dynamic contrast-enhanced MRI (DCE-MRI) features such as peripheral rim enhancement, faster enhancement, and washout curve type are correlated with overall recurrence and overall survival of breast cancer patients. [6,7]
