Temperature sensors connected are interfaced to microcontroller with the help of analog to digital converter. As, the signal generated from sensors is analog, so these analog signals are converted into digital and then fed to the microcontroller.

Applications of Interfacing Devices with Microcontroller
we need to measure these pulses train and find a way to extract data from these pulses. To get these pulses from sensor, we first need to send start signal in the form of pulse from microcontroller to DHT11 sensor. After that DHT11 sensor sends data to microcontroller in the form of pulses. It takes around 45ms to complete this process.

Microcontrollers have become very useful in embedded design as they can easily communicate with other devices, such as sensors, switches, LCD displays, keypads, motors and even other microcontrollers. A microcontroller is basically used as the brain or intelligent processing unit to control other devices connected (interfaced) to it in embedded systems just like a PLC in industrial automation.
