The basic syntax for creating line plots is `plt.plot(x,y)`, where `x` and `y` are arrays of the same length that specify the (x;y) pairs that form the line. For example, let's plot the cosine function from 2 to 1. To do so, we need to provide a discretization (grid) of the values along the x-axis, and evaluate the function on each `x` value.

`import numpy as np. import matplotlib.pyplot as plt. import seaborn as sns. import matplotlib.font_manager. %matplotlib inline import plotly.plotly as py. import plotly.graph_objs as go. plotly.tools.set_credentials_file (username='***', api_key='***') I went ahead and set up a data frame using pandas. The information we're graphing is as seen below:`

As we're now familiar with some of the features of Pandas, we will wade into visualizing our data in Python using the built-in

plotting options available directly in Pandas. Much like the case of Pandas being built upon NumPy, plotting in Pandas takes advantage of plotting features from the Matplotlib plotting library.

"[With pyplot], simple functions are used to add plot elements (lines, images, text, etc.) to the current axes in the current figure." [emphasis added] Hardcore ex-MATLAB users may choose to word this by saying something like, "`plt.plot()` is a state-machine interface that implicitly tracks the current figure!" In English, this means that:
