5 Phase Hybrid Stepping Motor

Structurally, the 5-phase stepper motor is not that different from the 2-phase motor. The rotor in both motors has 50 teeth. The difference is that because the 5-phase motor has 10 poles, 2 per phase, the rotor only has to move 1/10 of a tooth pitch to line up with the next phase.

When Phase is excited by supplying a positive current, the stator poles 1 and 5 becomes South poles and stator pole 3 and 7 becomes north poles. Now, when the Phase A is de-energized, and phase B is excited, the rotor will turn by a full step angle of 1.8° in the anticlockwise direction.

Hybrid Stepper Motor - its Working Advantages ...

A stepper motor rotates with a fixed step angle, just like the second hand of a clock. This angle is called "basic step angle." MOONS' offers several types of "basic step angle" as standard motors: 2-phase stepping motors with a basic

step angle of 0.9° and 1.8° and 3-phase stepping motors with a basic step angle of 1.2° .

With 50 rotor teeth moving 1/10 tooth pitch with each step, the 5-phase motor makes 500 steps per revolution, resulting in a basic step angle of 0.72 degrees. $\text{Step angle} = 360 \div (2 * 5 * 50) = 0.72$ degrees. A 1.8 ° motor is the same as a 200 step/revolution motor. The trade-off for high resolution is speed and torque. High step count motors top-out at lower RPMs than similar size. And the higher step-rates needed to turn these motors results in lower torque than a similar size low-step-count motor at similar speeds.
