When sound hits the material, the damping product stretches or extends (hence, extensional damping) and then compresses, converting the noise and vibrational energy into heat. Free layer damping controls vibration and noise in products with surfaces that are at or near resonance and is best for lightweight structures. This is because free layer damping does add a significant amount of weight to your structure, meaning that it is not ideal for

applications where limiting weight is a concern.

Welcome to Sound Damped Steel. Sound

Damped Steel (SDS) manufactures and supplies highly damped materials, complete kits and components that solve a very wide range of noise and vibration control problems at very low cost. These include both OEM applications where our materials are built-in by design plus retro-fit materials and kits of parts to reduce noise on existing plant and machinery. 20dB+ attenuation is often practical.

Dedsheet is designed to minimise radiation of noise created by ringing and vibration of sheet metal by sound damping and stiffening it. Also improves airborne sound insulation by adding mass. Unlike many conventional sound

damping sheets, Dedsheet remains flexible through temperatures from -30 degrees centigrade up to + 65 deg for limited periods and will not crack when flexed.

The studies of sound and vibration are closely related. Sound, or pressure waves, are generated by vibrating structures (e.g. vocal cords); these

pressure waves can also induce the vibration of structures (e.g. ear drum). Hence, attempts to reduce noise are often related to issues of vibration.
