Fitting a Thurstonian IRT model to forced-choice data ...

The thurstonianIRT package allows to fit various models from Item Response Theory (IRT) for forced-choice questionnaires, most notably the Thurstonian IRT model originally proposed by (Brown & Maydeu-Olivares, 2011). The key characteristic of forced-choice questionnaires is that participants cannot endorse all items at the same time and instead have to make a comparative judgment between two or more items.

A Thurstonian model is a stochastic transitivity model with latent variables for describing the mapping of some continuous scale onto discrete, possibly ordered categories of response. In the model, each of these categories of response corresponds to a latent variable whose value is drawn from a normal distribution, independently of the other response variables and with constant variance. Developments over the last two decades, however, have led to Thurstonian models that allow unequal variance

Thurstonian model - Wikipedia

The thurstonianIRT package allows to fit various models from Item Response Theory (IRT) for forced-choice questionnaires, most notably the Thurstonian IRT model originally proposed by (Brown & Maydeu-Olivares, 2011). IRT in general comes with several advantages over classical test theory, for instance, the ability to model varying item difficulties as well as item factor loadings on the participants' traits they are supposed to measure.
