Specific Gravity Of Sugar Solution

The mass of sugar is 4.00 cups x 200 g/cup = 800 g, and the mass of water is 5.00 cups x 226 g/cup = 1130 g or 1.13 x 10 3 g. So the total mass is 800 g + 1130 g = 1930 g or 1.93 x 10 3 g. Then
$$\rho = \frac{m}{V} = \frac{1930\text{ g}}{1680\text{ cm}^3}$$

dissolved solids = gravity * (brix * 10) The gravity tells us how much 1 litre of the liquid weighs (in kg) - we then multiply this by the dissolved solids ratio to give dissolved solids per litre. 'brix * 10' simply corrects the °Brix value from being grams per 100 grams to being grams per kg.

mass = x g of sugar + (y L of water*1000 mL/L*1g/mL) 1 g/mL = water density. Then measure the total volume (total mL) of the mix: density = (x g of sugar + (y L of water * 1000 mL/L * 1g/mL))/ (total mL) 2) For the reverse calculation, you can determine density as a function of sugar content by preparing solutions with different sugar concentrations and use this to interpolate your specific density value to a sugar concentration.
