The paper shows that the immersion and invariance (I&I) technique, which is widely popular for stabilization, state estimation, and adaptive control of nonlinear systems, can be used for orbital stabilization. As usual with the I&I method, a large flexibility exists in the election of target dynamics and the definition of the manifold that is rendered attractive and invariant, which can be exploited to simplify the controller design.

Two-dimensional Navier–Stokes simulations of this flow at a chord Reynolds number of 6×10^4 have been carried out to examine the nonlinear dynamics in this flow and its implications for synthetic-jet-based separation control. The results show that there is a strong nonlinear coupling between the various features of the flow, and that the uncontrolled as well as the forced flow is characterized by a variety of ‘lock-on’ states that result from this

nonlinear coupling.

In the case of systems with nonlinear dynamics, it provides sufficient conditions to control the system in the neighborhood of a trajectory or a steady state (refs. 1 and 18 and SI Appendix), and its definition of control (full control; from any initial to any final state) does not always match the meaning of control in biological, technological, and social systems, in which control tends to involve only naturally occurring system states (19).
