UV Spectroscopy- Principle, Instrumentation, Applications. Spectroscopy is the measurement and interpretation of electromagnetic radiation absorbed or emitted when the molecules or atoms or ions of a sample moves from one energy state to another energy state. UV spectroscopy is type of absorption spectroscopy in which light of ultra-violet region (200-400 nm) is absorbed by the molecule which results in the excitation of the electrons from the ground state to higher energy state.

They are ultraviolet photoelectron spectroscopy (UPS) and X-ray photoelectron spectroscopy (XPS). XPS is also known under its former name of electron spectroscopy for chemical analysis (ESCA). UPS focuses on ionization of valence electrons while XPS is able to go a step further and ionize core electrons and pry them away.

Photoelectron Spectroscopy: Application - Chemistry LibreTexts

Electrons bound to atoms and molecules have kinetic energies corresponding to ultraviolet (UV) and x-ray light, on the high-energy (short wavelength, high frequency) end of the EM spectrum. There are two principal methods of PES, ultraviolet (UV) photoelectron spectroscopy (UPS) and X-ray PES (XPS). These are diagrammed and described below.
