Decision tree learning is one of the predictive modelling approaches used in statistics, data mining and machine learning. It uses a decision tree to go from observations about an item to conclusions about the item's target value. Tree models where the target variable can take a discrete set of values are called classification trees; in these tree structures, leaves represent class labels and branches represent conjunctions of features that lead to those class labels. Decision trees where the ta

Decision tree regressor trains a model in a tree like formation and predicts the data for future to have meaningful continuous output. The meaning of continuous output means that it is not denoted by known set of values or numbers. Tabular, or structured data that comes in the form of a table, is natural for a decision tree. Most everyone agrees a neural network is overkill for tabular data regression and prediction, so we make a few simplifications. We choose ones and zeroes opposed to probabilities, which is the primary root of differences between the two algorithms.

When and Why Tree-Based Models (Often) Outperform Neural ...

This is because a decision tree inherently "throws away" the input features that it doesn't find useful, whereas a neural net will use them all unless you do some feature selection as a pre-processing step. If it is important to understand what the model is doing, the trees are very interpretable.

data structures - Decision trees vs. Neural Networks ...

If your neural network performs well on the training data with a purely linear structure, it may be better to use a pruned decision tree regression, which emulates the linear and high-variance of the neural network but allows the data scientist more control over the depth, width, and other attributes to control over-fitting.
