Because of its ability to make non-contact full-field measurements on most materials, and because the output is directly related to stress (as distinct to many other full-field techniques which are sensitive only to displacement, thereby requiring differentiation to yield strain/stress), TSA has quickly established itself as a powerful means of experimental stress analysis. Since 1982, TSA applications have grown both in number and in scope.

Stress-strain analysis is an engineering discipline that uses many methods to determine the stresses and strains in materials and structures subjected to forces. In continuum mechanics, stress is a physical quantity that expresses the internal forces that neighboring particles of a continuous material exert on each other, while strain is the measure of the deformation of the material. In simple terms we can define stress as the force of resistance per unit per unit area, offered by a body ...
