We therefore offer a simple classification of tumor antigens based on three criteria: tissue-expression profile, genomic origin and mutational status (Table 1). Tumor-associated antigens (TAAs) are MAPs that show superior abundance on tumor cells but are nonetheless present on

normal cells, and may therefore induce central immune tolerance .

To improve the effectiveness of

immunotherapy, the identification of highly immunogenic tumor antigens is very important. The cDNA expression cloning method has been used to identify genes coding for tumor antigens using CTL. (10-12) Another method to detect tumor antigens is serological analysis of recombinantly expressed cDNA clones, named SEREX. A number of tumor antigens have been identified by the SEREX method using patients' sera.

One of the first approaches to the identification of human tumor-specific antigens was to immunize mice with human tumor cells and use the new hybridoma technology to immortalize B cells

and find the rare clones producing monoclonal antibodies that recognized tumors but not normal cells of the same tissue type. These antibodies were then used for purification of their cognate antigens and for characterization of their expression in tumors versus normal tissues.
