Modulation Of Hepatic Acute Phase

CONCLUSIONS: These results show that certain fatty acids have the potential to modulate spontaneous and cytokine-induced alterations in human hepatic acute phase protein metabolism. These data indicate the presence of complex mechanisms of regulation of human hepatic protein metabolism by fatty acids, and further study will be required to establish the nature of their influence in vivo.

The increased production of acute phase plasma proteins (APP) by the liver in response to inflammation at extrahe-patic sites is proposed to be mediated primarily by the concerted action of interleukin-1 (IL-1)- and IL-6-type cytokines and glucocorticoids.1,2 However, the level of expres-sion and cytokine regulation of individual APPs appears also

Hence, IL-1β substantially modifies IL-6-induced acute phase protein production as it almost completely abrogates production of acute phase proteins such as γ-fibrinogen, α 2-macroglobulin or α 1-antichymotrypsin, whereas production of for example hepcidin, C-reactive protein and serum amyloid A is strongly up-regulated. This switch-like regulation of IL-6-induced acute phase protein production by IL-1β is due to a complex processing of the intracellular signaling events activated in ...
