the way the mounts work is that there is a fluid chamber with a plastic body in the middle of it, with small channel cut through it. this allows fluid from the top chamber, through the plastic body, to the bottom chamber. the bottom chamber is rubber lined and can deform under pressure. there is also an airway vented to atmosphere, with a rubber membrane separating the fluid from the atmosphere. a solenoid valve, controlled by the motronic, can open or close the airway.

After you remove the coil (black/ round
 thing), feel the stem for any dents or
 bulging. After you remove the valve,
 make sure the stem inside moves in and
 out freely. There should be about .090"
 of travel on a good valve. I do agree that
 swapping controllers is the quickest way
 to start. Also, be aware of any ice that
 could of formed in the valves.
