Dynamic Modeling In The Health

Three dynamic simulation modeling methods are presented to evaluate system interventions for health care delivery: system dynamics, discrete event simulation, and agent-based modeling. In contrast to conventional evaluations, a dynamic systems approach incorporates the complexity of the system and anticipates the upstream and downstream consequences of changes in complex health care delivery systems.

SD models solve the problem of simultaneity (mutual causation) by updating all variables in small time increments with positive and negative feedbacks and time delays structuring the interactions and control. The best known SD model is probably the 1972 The Limits to Growth. This model forecast that exponential growth of population and capital, with finite resource sources and sinks and perception delays, would lead to economic collapse during the 21st century under a wide variety of growth ...

A dynamic approach of the interaction between health professional and patient models this communication process. Since most interventions in curricula implicitly use a (elaborated) static communication model, we conclude that a dynamic interaction model is relevant for the training of medical students and practioners in dealing with patients with low levels of health literacy.
