It follows easily that any curve from p to the boundary of $B_r(p)$ has length at least λr , where λ is the minimum of $\lambda(x)$. However, given $q \in B_r(p)$, we may assume that r has been chosen sufficiently small so that $q \in B_{r/2}(p)$. Then any curve from p to q must contain an initial segment from p to the boundary of $B_{r/2}(p)$.
