A stripline circuit uses a flat strip of metal which is sandwiched between two parallel ground planes. The insulating material of

the substrate forms a dielectric. The width of the strip, the thickness of the substrate and the relative permittivity of the substrate determine the characteristic impedance of the strip which is a transmission line.

Stripline - Wikipedia

Stripline Design

Stripline transmission line requires three layers of conductors where the internal conductor is commonly called the “hot conductor,” while the other two, always connected at signal ground, are called “cold” or “ground” conductors.

The prototype stripline combline filter was

designed on a circuit laminate with relative dielectric constant of 3.38 and thickness of 0.98 mm (RO4003C material from Rogers Corp.). A line width was established at $W = 0.55$ mm with a line length of $L = 20$ mm and trace thickness $t = \mu\text{m}$ for all the filter line elements except the terminating lines.
