Living systems have two primary mechanisms for moving substances in and out of the cell – passive and active transport. In passive transport the cell uses no energy (ATP) as essential substances are moved across the plasma membrane. Examples of molecules moved by the various means of passive transport are oxygen, water, and glucose.

Lab #6: Cellular Transport Mechanisms Lab

Transport across the Cell Membrane One of the great wonders of the cell membrane is its ability to regulate the concentration of substances inside the cell. These substances include ions such as Ca^{++} , Na^{+} , K^{+} , and Cl^{-} ; nutrients including sugars, fatty acids, and amino acids; and waste products, particularly carbon dioxide (CO_2), which must leave the cell.

In the cell membrane transport lab, there were many experiments that were done such as osmosis, diffusion in a gel, diffusion in a liquid, diffusion in air, and filtration. A cell membrane transport lab is done to understand the different ways of transport and why they are all important since it relates to the human body.

Lab: Osmosis across a semi-permeable membrane. Osmosis is the diffusion of water from high concentration to low concentration. When you drink water, your cells have a lower concentration of water than the water in your digestive system. So water flows across the cell membrane (from high concentration to low concentration) of your cells hydrating you.

Facilitated transport proteins shield these materials from the repulsive force of the membrane, allowing them to diffuse into the cell. The material being transported is first attached to protein or glycoprotein receptors on the exterior surface of the plasma membrane.

Transport Across Membranes | Boundless Anatomy and Physiology

Membrane channels and diffusion facilitators bring them through the membrane by passive transport; that is, the changes that the proteins undergo in order to facilitate diffusion are powered by the diffusing solutes themselves. For the healthy functioning of the cell, certain solutes must remain at different concentrations on each side of the membrane; if through diffusion they approach equilibrium, they must be pumped back up their gradients by the process of active transport.

By Janet Rae-Dupree, Pat DuPree. Think of it as a gatekeeper, guardian, or border guard. Despite being only 6 to 10 nanometers thick and visible only through an electron microscope, the cell membrane keeps the cell's cytoplasm in place and lets only select materials enter and depart the cell as needed. This semipermeability, or selective permeability, is a result of a double layer (bilayer) of phospholipid molecules interspersed with protein molecules.
