Membrane Technologies For Water Treatment

One key issue that often plagues the implementation of membrane technologies for water treatment is fouling. Fouling happens over time, when molecules, debris, cells and materials accumulate on the surface of the membrane, significantly degrading their performance. Membrane fouling leads to higher energy consumption because water has to be “pushed through” additional materials that have collected on the membrane surface.

(PDF) Membrane Technology for Water Treatment Applications

There are two classes of membrane treatment systems low-pressure membrane systems (such as microfiltration and ultrafiltration) and high-pressure membrane systems (such as nanofiltration and reverse osmosis). Low-pressure membranes, including microfiltration (MF) and ultrafiltration (UF), are operated at pressures ranging from 10 to 30 psi, whereas high-pressure membranes, including nanofiltration (NF) and reverse osmosis (RO), are operated at pressures ranging from 75 to 1000 psi.

Membrane Filtration (MF/UF): Low pressure microfiltration (MF) and ultrafiltration (UF) membrane technology have emerged as viable options for addressing current and future drinking water regulations related to the treatment of surface water, groundwater under the influence, and water reuse

applications for microbial and turbidity removal.

Membrane Technology Fact Sheets

In water treatment, membranes are barriers that allow water to pass through but stop unwanted substances from passing through with it. Working much like the cell walls in our bodies, technical membranes filter out salts, impurities, viruses, and other particles from water.

Membrane Technology - Water Treatment and Purification

Historically, nanofiltration and other membrane technology used for molecular separation was applied entirely on aqueous systems. The original uses for nanofiltration were water treatment and in particular water softening. Nanofilters can "soften" water by retaining scale-forming, hydrated divalent ions (e.g. Ca 2+, ...

Nanofiltration - Wikipedia

Mocanu and others developed a synthetic procedure for hybrid ultrafiltration membrane for water treatment. They used wet-phase inversion method with polysulfone and graphene nanoplatelets modified with poly (styrene) to obtain their membranes. ZnO was deposited on one surface of the membrane with polymers that are soluble in water [39].
