Exchanger Surfaces

In this case, the surfaces are fouled by accumulation of the products of chemical reactions on the surfaces. This form of fouling can be avoided by coating the heat exchanger surfaces by glass. Heat exchanger surfaces can also be fouled by growth of algae in warm fluids (chemical fouling) which can be prevented by chemical treatment.

Description. This unique and comprehensive text considers all aspects of heat exchanger fouling from the basic science of how surfaces become fouled to very practical ways of mitigating the problem and from mathematical modelling of different fouling mechanisms to practical methods of heat exchanger cleaning.

Fouling of Heat Exchangers | ScienceDirect

Fouling of heat transfer surfaces is one of the

most important problems in heat transfer equipment. Fouling is an extremely complex phenomenon. Fundamentally, fouling may be characterized as a combined, unsteady state, momentum, mass and heat transfer problem with chemical, solubility, corrosion and biological processes may also taking place.

Fouling of Heat Transfer Surfaces - IntechOpen

During fouling, the surface of a heat exchanger wall develops another layer of solid material. This can happen for a variety of reasons. But as a result, the heat transfer coefficient at the surface is drastically reduced, since the heat

conducting wall metal is not in contact with the fluids any more.

Heat exchanger fouling - EnggCyclopedia

Fouling in Heat Exchanger Fouling can be defined as the deposition of unwanted material on heat transfer surface. Fouling is an inescapable consequence of heat transfer between two flowing streams across a metal wall. The degree of fouling varies considerably with the nature of fluids being handled.

Fouling is generally defined as the accumulation and formation of unwanted

(PDF) Fouling of Heat Transfer Surfaces - ResearchGate

Biological fouling is caused by the growth of organisms, such as algae, within the fluid which deposit out onto the surfaces of the heat exchanger. While outside the direct control of heat exchanger designers, it can be influenced by the choice of material. For example non-ferrous brass materials are poisonous to some organisms.

Understanding and preventing heat exchanger fouling

Online monitoring of

commercial heat exchangers is done by tracking the overall heat transfer coefficient, because the overall heat transfer coefficient tends to decline over time due to fouling. Fouling is the accumulation of unwanted material on solid surfaces to the detriment of function. The fouling materials can consist of either living organisms or a non-living substance (minerals or organic compounds).

What is Fouling - Fouling Factor - Definition

Fouling is the accumulation of unwanted material on the tube surfaces of the heat exchanger. After a period of operation the heat transfer surface of heat

exchanger may become coated with various deposits presents in flow system. This coating represents an additional resistance to heat flow and thus decreased in performance.

Types Of Fouling In Heat Exchangers

The following fouling scenarios can be distinguished, depending on the nature of the system and the local thermohydraulic conditions at the surface: Induction period. Sometimes, a near-nil fouling rate is observed when the surface is new or very clean. This is often... "Negative" fouling. This can ...

Fouling - Wikipedia

The fouling factor

represents the theoretical resistance to the heat flow due to the build-up of a layer of dirt or other fouling substances on the tube surfaces of the heat exchanger. These dirt levels are often played down by the end user in an attempt to minimize the frequency of cleaning.

Fouling and plate heat exchangers - Heat Exchanger World

During the lifetime of a heat exchanger its performance will be influenced by what happens on the surface where the heat is exchanged. On the surface deposits of materials can accumulate that reduce the heat transfer and increase the pressure drop. This is referred to as

fouling.

Engineering Page > Heat Exchangers > Fouling

The comparison shows that deposit formation onto heat transfer surfaces decreases with increasing the new proposed fouling propensity indicator criterion. Moreover, nearly 75% of the collated crystallization and biological fouling data points are predictable with this criterion and reasons for those that are not in compliance with the proposed criterion are discussed.

Fouling in Heat Exchangers | IntechOpen

Fouling can result in

major performance and operational issues.

Over time, tube surfaces become covered by naturally built-up deposits to form an insulated layer. As the overall heat transfer surface becomes layered with particles such as ash, soot, bio, dirt, etc., an increase in energy consumption is

required to compensate.

HeatX - Omniphobic Surface Treatment

During the synthesis and processing of polymers, a significant amount of polymer may be deposited on the heat transfer surfaces. This deposit is unwanted and is usually named fouling.
