From current setting we calculate the trick current of the relay. Say current setting of the relay is 150 % therefore pick up current of the relay is $1 \times 150\% = 1.5 \text{ A}$.
Step-3 Now we have to calculate PSM for the specified faulty current level. For that, we have to first divide primary faulty current by CT ratio to get relay faulty current.

Transformer Protection Application Guide This guide focuses primarily on application of protective relays for the protection of power transformers, with an emphasis on the most prevalent protection schemes and transformers. Principles are emphasized. Setting procedures are only discussed in a general nature in the material to follow.

Transformer Protection Application Guide

$I_d = I_{1s} - I_{2s}$ In principle, this basic approach of a differential protection scheme is implemented using an overcurrent relay placed in the differential current path formed by the two current transformer

secondary circuits.

Application and Setting Guide - ABB

The relay will now use 30% of this ITOT to derive its actual restraint current, i.e. $I_{rest} = 0.3 \times 0.5 = 0.15A$ (see point P on the restraint characteristic). Now if $I_{DIFF} > 0.15A$ relay operation results. Alternatively, 0.15A is the minimum diff current required for relay operation if the system loading is 0.5A (sec).

 b) Slope 1: Assume type A relay (ITOT = I_{res}): $K1 = I_{dif}/I_{res} = 0.1/0.5 \times (0.555 + 0.655) = 0.17$ or 17% then a 20% setting is good. C) Turning Point 2, ITP2 Slope 1 dictates the relay restraint characteristic over the load current range of the transformer.
