Updates of the ACLS Guidelines 2015. A Historical Comparison *GRIN Verlag*

Literature Review from the year 2017 in the subject Medicine - Hospital Environment, Clinical Medicine, grade: 1, Egerton University, language: English, abstract: Over the years, the American Heart Association has made outstanding contributions and numerous improvements to cardiopulmonary resuscitation and advanced cardiac life support guidelines. It is due to adequate use of resources and continuous research that millions of lives are saved

in the United States. Such guidelines serve health care providers and other members of the healthcare team as a resource to ensure adequate and timely response to those individuals who experience cardiac or respiratory arrest. However, according to AHA statistics, "More than 326,000 people in the US suffer out-of-hospital cardiac arrests each year. Statistics prove that if more people knew CPR, more lives could be saved" (American Heart Association, 2016). In other words, dissemination of knowledge on the matter has direct outcomes on increasing survival rates. Therefore, the guidelines and the implementation methods are on continuous review based on new evidence. It is important to provide those who suffer cardiac or respiratory arrest

with timely services because delays could end up affecting the outcome of those who experience reversible damage. Healthcare providers around the world have become informed on the benefits of updated competence and direct patient outcomes and quality of care. The American Heart Association has published the new 2015 cardiopulmonary resuscitation guidelines, where changes and updates are reflected in an effort to put the best available evidence in practice. The purpose of this review is to compare the 2015 AHA updates with historical evidence in an attempt to explicate the implications and limitations of pharmacology in advanced cardiac life support.

Strategies to Improve Cardiac Arrest Survival *National Academies Press*

Cardiac arrest can strike a seemingly healthy individual of any age, race, ethnicity, or gender at any time in any location, often without warning. Cardiac arrest is the third leading cause of death in the United States, following cancer and heart disease. Four out of five cardiac arrests occur in the home, and more than 90 percent of individuals with

cardiac arrest die before reaching the hospital. First and foremost, cardiac arrest treatment is a community issue - local resources and personnel must provide appropriate, high-quality care to save the life of a community member. Time between onset of arrest and provision of care is fundamental, and shortening this time is one of the best ways to reduce the risk of death and disability from cardiac arrest. Specific actions can be implemented now to decrease this time, and recent advances in science could lead to new discoveries in the causes of, and treatments for, cardiac arrest. However, specific barriers must first be addressed. *Strategies to Improve Cardiac Arrest Survival* examines the complete system of response to cardiac arrest in the United

States and identifies opportunities within existing and new treatments, strategies, and research that promise to improve the survival and recovery of patients. The recommendations of Strategies to Improve Cardiac Arrest Survival provide high-priority actions to advance the field as a whole. This report will help citizens, government agencies, and private industry to improve health outcomes from sudden cardiac arrest across the United States.
