Statistical Models Based on Counting Processes

In statistics, count data is a statistical data type, a type of data in which the observations can take only the non-negative integer values $\{0, 1, 2, 3, \dots\}$, and where these integers arise from counting rather than ranking. The statistical treatment of count data is distinct from that of binary data, in which the observations can take only two values, usually represented by 0 and 1, and from ordinal data, which may also consist of integers but where the individual values fall on an arbitrary scale.

Regression Models with Count Data - IDRE Stats

Odd Aalen in his thesis work developed a lot of the theory of counting processes. Since survival analysis is based on time to event data and the study of the reliability of repairable systems involves counting recurrences point or counting processes can be used to construct statistical models that can be used in these disciplines.
