In computer vision triangulation refers to
 the process of determining a point in 3D
 space given its projections onto two, or
 more, images. In order to solve this
 problem it is necessary to know the
 parameters of the camera projection
 function from 3D to 2D for the cameras
 involved, in the simplest case
 represented by the camera matrices .

Triangulation (computer vision) - Wikipedia

 Vision. A basic problem in computer
 vision is to understand the structure of a
 real world scene given several images of
 it. Techniques for solving this problem
 are taken from projective geometry and

photogrammetry.

**Multiple View Geometry in
Computer Vision - Richard ...**

Epipolar geometry is the geometry of stereo vision. When two cameras view a 3D scene from two distinct positions, there are a number of geometric relations between the 3D points and their projections onto the 2D images that lead to constraints between the image points. ... Two-view geometry is next, with the author describing the epipolar geometry of two cameras and projective reconstruction from resulting image map correspondences. Part three of the book extends ideas to three cameras and the resulting trifocal geometry. The final section of the book takes the algorithms of the book to N views.
