A Black Hole Is Not

No, a black hole is not really a hole at all. A black hole is an object just like any other, except that it is extremely dense. This gives it such a high gravitational field that nothing, not even light, can escape. Because no light escapes a black hole, it is invisible – or ‘black’ – although they can be detected by their effect on the material around them.

Is a black hole a hole? - BBC Science Focus Magazine

After reanalysing the data, separate teams of scientists have concluded that the system in question, named HR 6819, does not include a black hole after all. Instead, they have found that it's likely just two stars with a slightly unusual binary orbit that makes it difficult to interpret.

The Closest Black Hole to Earth May Not Actually Be a ...

A black hole can not be seen because strong gravity pulls all of the light into the middle of the black hole. But scientists can see how the strong gravity affects the stars and gas around the black hole. Scientists can study stars to find out if they are flying around, or orbiting, a black hole.

What Is a Black Hole? | NASA

It was considered that a binary star system HR 6819 had a black hole in it. But now, scientists have discovered that there is no black hole there at all. One of the two stars in the system is a Be spectral type and the other is B3 III star. Both the stars were considered to have equal mass.

The researchers in this study attempted to make the math of black holes fit within this framework and discovered that the only way it works is if black holes are in fact not singularities at all....

Black holes might not be black holes at all - BGR

A black hole is an object — typically a collapsed star — whose gravity is so strong that its escape velocity exceeds the speed of light. Since nothing is known to exceed the speed of light , nothing can escape from a black hole.

Sorry, Black Holes Aren't Actually Black

Black holes are freezing cold on the inside, but incredibly hot just outside. The internal temperature of a black hole with the mass of our Sun is around one-millionth of a degree above absolute zero. Just outside the hole, however, the material being pulled into the hole's gravity well is accelerated to near the speed of light.

Are black holes hot or cold? - BBC Science Focus Magazine

A black hole is a region of spacetime where gravity is so strong that nothing—no particles or even electromagnetic radiations such as light—can escape from it. The theory of general relativity predicts that a sufficiently compact mass can deform spacetime to form a black hole.

Black hole - Wikipedia

The 85-solar-mass black hole is such a mystery because of how scientists think massive stars die. For all their nuclear fury, stars are objects in balance: Gravity compresses stars inward, but as...

Astronomers spot the biggest, strangest black hole ...

Black hole, cosmic body of extremely intense gravity from which nothing, not even light, can escape. A black hole can be formed by the death of a massive star . When such a star has exhausted the internal thermonuclear fuels in its core at the end of its life , the core becomes unstable and gravitationally collapses inward upon itself, and the star's outer layers are blown away.

Cause-and-Effect Structure in A Black Hole Is NOT a Hole

...
A black hole is an extremely dense object in space from which no light can escape. While black holes are mysterious and exotic, they are also a key consequence of how gravity works: When a lot of mass gets compressed into a small enough space, the resulting object rips the very fabric of space and time, becoming what is called a singularity.

A Black Hole Is Not a Hole: DeCristofano, Carolyn Cinami

...

A hint of how such 'upper mass gap' black holes could form was already given to us by GW150914, the first-ever gravitational wave detection. That event was a merger of a 36 solar mass black hole with a 29 solar mass black hole, forming a 'second-generation' (2g) black hole weighing 62 solar masses.
