Hence, it is vital to understand the interaction of ILs with cell membranes. Here, we report on the effects of an imidazolium-

based IL, 1-decyl-3-methylimidazolium tetrafluoroborate (DMIM[BF₄]), on the microscopic dynamics of a membrane formed by liver extract lipid, using quasielastic neutron scattering (QENS).

In this review, we will explore the structure and dynamics of cationic membrane peptides and proteins in lipid bilayers as learned from solid-state NMR. Although hydrophobic amino acid residues dominate in large functional membrane proteins, cationic residues such as Arg and Lys are numerous in many membrane peptides, whose biological functions require them to disrupt or cross the lipid membrane (Table I).

Abstract. Solid-state nuclear magnetic resonance (SSNMR) spectroscopy elucidates membrane protein structures and dynamics in atomic detail to yield mechanistic insights. By interrogating membrane proteins in phospholipid bilayers that closely resemble biological membranes, SSNMR spectroscopists have revealed ion conduction mechanisms, substrate transport dynamics, and oligomeric interfaces of seven-transmembrane helix proteins.

As SSNMR techniques increasingly mature and become well adopted to determine high-resolution structures of membrane proteins, elucidating protein conformational dynamics and conformational plasticity, unraveling protein-lipid interactions, and illuminating how membrane proteins interact with ions, drug molecules, ligands, and other proteins, will become ever more important areas of discovery.

We further provide emerging information and insight from studies on interactions of membrane lipids (such as cholesterol) with serotonin receptors. We envision that a judicious combination of analysis of high-resolution structures and receptor-lipid interaction would allow a comprehensive understanding of GPCR structure, function and dynamics, thereby leading to efficient drug discovery.
