Carbon Dioxide Storage In Geological

Deep geological formations. Storage in deep geological formations is also known as 'geo-sequestration'. In this technique, carbon dioxide is converted into a high pressure, liquid-like form known as 'supercritical CO₂'. Supercritical CO₂ behaves like a runny liquid, rather like WD40, and is injected directly into sedimentary rocks. The rocks may be in old oil fields, gas fields, or in saline formations — rocks with porous spaces filled with salty water.

Historic CO₂ storage capacity data between 1996—the year that the first commercial geologic storage project (Sleipner, Norway) began —and 2020 indicate an annual growth rate of 8.6%. A continuation of growth at this rate through 2100 would result in cumulative storage in 2100 of 441 Gt (light blue line in Fig. 3).

Global geologic carbon storage requirements of climate ...

One of the essential features of a geologic formation suitable for carbon dioxide storage is the presence of impermeable seal layers or caprocks above the zone in which the carbon dioxide is stored, to prevent leakage and

upward migration of carbon dioxide toward the surface. Leakage could result in contamination of underground sources of drinking water, which are at shallower depths than the geologic reservoirs under consideration for storage of CO₂.

Carbon sequestration - Wikipedia

Carbon capture and storage (CCS), or carbon capture and sequestration and carbon control and sequestration, is the process of capturing waste carbon dioxide (CO₂) usually from large point sources, such as a cement factory or biomass power plant, transporting it to a storage site, and depositing it where it will not enter the atmosphere, normally an underground geological formation.
