DOI:10.1093/acprof:oso/9780199644513.003.0011. Optical transitions in quantum wells occur between closely spaced states associated with unconfined motion in the plane of the well within sub-bands formed by confinement across the well. The energy spacing of the unconfined states is much less than the homogeneous linewidth, so the transition rate is given by Fermi’s Golden Rule.

Quantum Confined Laser Devices Optical gain and ...
Light matter interactions are greatly enhanced in two-dimensional (2D) semiconductors because of strong excitonic effects. Many optoelectronic applications would benefit from creating stacks of atomically thin 2D semiconductors separated by insulating barrier layers, forming multiquantum-well structures. However, most 2D transition metal chalcogenide systems require serial stacking to create ...
