A Ghost Cell Immersed Boundary

Abstract. An efficient ghost-cell immersed boundary method (GCIBM) for simulating turbulent flows in complex geometries is presented. A boundary condition is enforced through a ghost cell method. The reconstruction

procedure allows systematic development of numerical schemes for treating the immersed boundary while preserving the overall second-order accuracy of the base solver.

To this end, a general boundary condition treatment, using the ghost-cell immersed boundary method for compressible flows, is developed and validated in the present work. The interaction between immersed bodies and the fluid is expressed by ghost points inside the immersed bodies, and these ghost points ensure that boundary conditions are satisfied precisely on the

immersed boundary.

In the conventional ghost-cell immersed boundary method the boundary forcing term f is implemented implicitly in the momentum equation in order to enforce the boundary condition at each time step. Hence, f is not evaluated explicitly and is set to 0 in the computation. Instead, the boundary forcing is implicitly coupled to the convective and diffusive terms in Eq.

A sharp-interface ghost-cell immersed-boundary method is coupled with a mass source and sink algorithm to improve the conservation of mass across non-grid conforming immersed boundaries. To facilitate the control for the temporal discontinuity in the flow field due to a motion of an immersed body, a fully-implicit

An alternative sub-method of direct forcing, named ghost-cell immersed boundary method, is also used by some researchers , for complex geometries. In this method, the ghost cell (solid node which has at least one neighbouring fluid node) is given a velocity such that the interpolated velocity at the solid surface is equal to the desired velocity to be imposed.

It has been previously shown that the ghost-cell linear immersed boundary methods (IBMs) have two major drawbacks. Firstly, these methods tend to have a maximum stencil size larger than 1, yielding non-band matrices, and as a result they generally rely on the more generic and less efficient solvers.
