Resonance is not often a concern when short, rigid shaft pumps are operated at their design speed. Even if a natural frequency resides between zero and full speed, it is passed quickly during starting. The widespread use of VFDs, however, have led many to consider the effect of resonant frequency and critical speed on pump operation.

ANALYSIS GUIDE FOR VARIABLE FREQUENCY DRIVE OPERATED ...

The characteristics of stiffness, mass and damping explain why resonance is such a common problem on vertical turbine pumps. These are heavy machines (high mass) that are suspended with little support (low stiffness) and made mostly of metal (low damping), so the possibility of a resonance problem depends on how closely their natural frequencies match the rotating speed or other exciting frequencies.

Limiting Vibration Issues in Vertical Turbine Pumps ...

The second method for determining structural natural frequencies on a vertical pump is the impact test, commonly referred to as a “bump test.” The procedure requires that a pump

be stopped and subjected to an impact using a block of wood or a large, soft-tipped hammer, i.e., modal hammer.
