The Clifford algebra calculus is used to construct new models that allow descriptions of the group of projective transformations and inversions with respect to hyperquadrics. Afterwards, chain geometries over Clifford algebras and their subchain geometries are examined. The author applies this theory and the developed methods to the homogeneous Clifford algebra model

corresponding to Euclidean geometry. Moreover, kinematic mappings for special Cayley-Klein geometries are developed.

Abstract. The geometric algebra as defined by D. Hestenes is compared with a constructive definition of Clifford algebras. Both approaches are discussed and the equivalence between a finite

geometric algebra and the universal Clifford algebra $R_{p,q}$ is shown. Also an intermediate way to construct Clifford algebras is sketched.

We flesh out the affine geometry of $\mathbb{R}^3$ represented inside the Clifford algebra $\mathbb{R}_{(4,4)}$. We show how lines and planes as well as conic sections and quadric surfaces are represented in this model. We also investigate duality between different representations of points, lines, and planes, and we show how to represent intersections between these ...

Examples of geometric algebras applied in physics include the spacetime algebra (and the less common algebra of physical space) and the conformal geometric algebra. Geometric calculus , an extension of GA that incorporates differentiation and integration , can be used to formulate other theories such as complex analysis and differential geometry , e.g. by using the Clifford algebra instead of ...
