Reactive Power And Compensation

Reactive power (VAR) compensation is defined as the management of reactive power to improve the performance of ac systems. There are two aspects:- a) Load Compensation - The main objectives are to :- (i) increase the power factor of the system (ii) to balance the real power drawn from the system (iii) compensate voltage regulation (iv) to eliminate current harmonics.

Reactive Power Compensation - Electrical idea

Since most loads are inductive and consume lagging reactive power, the compensation required is usually supplied by leading reactive power. Shunt compensation of reactive power can be employed either at load level, substation level, or at transmission level. It can be capacitive (leading) or inductive (lagging) reactive power, although in most cases compensation is capacitive. The most common form of leading reactive power compensation is by connecting shunt capacitors to the line.

The Need for Reactive Power Compensation

The area of reactive power compensation is gaining increasing importance worldwide. If suitably designed, it is capable of improving voltage quality significantly, meaning that losses in equipment and power systems are reduced, the permissible loading of equipment can be increased, and the over-all stability of system operation improved.

Reactive Power Generation and Compensation,Advantages

Power Factor Improvement Reactive Power Compensation: Power Factor is nothing but the ratio of real power to apparent power. It is unit less quantity. Sometime for sinusoidal wave the power factor is defined as the cosine of angle between voltage and current.

Power Factor Improvement | Reactive Power Compensation ...

Reactive power is necessary to generate magnetic fields, e.g. in motors, transformers and generators. This power oscillates between the source and the load and represents an additional loading. Power supply companies and the consumers of this electrical energy are interested in reducing these disadvantages as well as possible.

4 example calculations of compensation for reactive power ...

Voltage levels and reactive power flow must be carefully controlled to allow a power system to be operated within acceptable limits. A technique is known as reactive compensation is used to reduce apparent power flow to a load by reducing reactive power supplied from transmission lines and providing it locally. For example, to compensate an inductive load, a shunt capacitor is installed close to the load itself.

AC power - Wikipedia

Another way to explain this is that reactive power is the resultant power in watts of an AC circuit when the current waveform is out of phase with the waveform of the voltage, usually by 90 degrees if the load is purely reactive, and is the result of either capacitive or inductive loads.

What is Reactive Power? - Definition from Techopedia

The reactive power is measured in kilo volt-ampere reactive (KVAR) or MVAR. Apparent Power. Definition: The product of root mean square (RMS) value of voltage and current is known as Apparent Power. This power is measured in kVA or MVA. It has been seen that power is consumed only in resistance. A pure inductor and a pure capacitor do not consume any power since in a half cycle whatever power is received from the source by these components, the same power is returned to the source. This ...

What is Active, Reactive and Apparent Power - definition ...

Reactive power is an essential component of ac electric power systems: without it, rotating machines could not rotate, and transmission lines could not transmit active power. The ability to control or compensate reactive power has many benefits. Reactive compensation is the process of adding or injecting positive and/or negative VAR's to a power system to essentially attain voltage control.

This reactive power should be properly compensated otherwise, the ratio of actual power consumed by the load, to the total power i.e. vector sum of active and reactive power, of the system becomes quite less. This ratio is alternatively known as the electrical power factor, and a lower ratio indicates a poor power factor of the system.
