Chem 111: Experiment 1. Introduction: The Mole. As with any area of technical expertise, chemists have a unit of quantity, known as the mole. It is no different from, say, a unit of length; e.g. a meter. Having distance in meters allows one to convert it to any other unit of choice, by simply looking up the relevant conversion factor. So too with the mole, once it is known for any substance in a given chemical reaction, then the quantity of all other substances can be derived by using the ...

Here, we report on a combined experimental and theoretical study of MAA adsorption on Ni{111}. XPS shows that the chemisorbed layer is stable up to 250 K; above 250 K, decomposition sets in. In ultra-high-vacuum conditions, multilayers grow below 150 K. DFT modeling predicts a deprotonated enol species with bidentate coordination on the flat Ni{111} surface.

Cuprous oxide (Cu_2O) is a promising catalyst for several important reactions. However, the atomic structures of defective Cu_2O surfaces, which critically affect the catalytic properties both thermodynamically and kinetically, are not unambiguously characterized. High-resolution scanning tunneling microscopy (STM), combined with density functional theory (DFT) calculations and STM simulations, has been used to determine the atomic structure of the (111) surface of a Cu_2O bulk crystal.
