One of the more common processing
configurations is the material recycle

structure. These are particularly useful
for reactors, where they allow better
control of reactor selectivity when
multiple reactions occur. When we study
recycle systems, we are often asked to
calculate the recycle ratio. Usually, this
is found by dividing the mass flow of the
recycle stream by the mass flow of the
"fresh feed" entering the system.

CHE 31. INTRODUCTION TO CHEMICAL ENGINEERING CALCULATIONS

The kinetic and the potential energy are negligible in many chemical reaction engineering applications, so Equation 15 becomes $Q - V E = Q - V (U + K + E_P) \approx Q - V U$ (16) we know that U is a function of the enthalpy, pressure, and volume, so $Q - V U = Q - V (H - PV) = Q - V H + V P = \sum_{i=1}^N \dot{Q}_i - \sum_{i=1}^N \dot{V}_i H_i + \dot{V} P$
