Show that it has no feasible solution using SIMPLEX METHOD. It

seems very logical that it has no feasible solution(how can a value be less than \$0.6\$ and greater than \$2\$ at the same time). When I tried solving it using simplex method, I found that it has an unbounded solution(as corresponding to the maximum(positive) value of $c_j - z_j$, all values in the corresponding column were either negative or zero).

If you are using the Simplex LP Solving method, and the model is well scaled, Solver has determined for certain that there is no feasible solution. If you are using the GRG Nonlinear Solving method, this method (which always starts from the initial values of the variables) was unable to find a feasible solution; but there could be a feasible solution far away from these initial values, which Solver might find if you run it with different initial values for the variables.

INFEASIBLE SOLUTION IN SIMPLEX METHOD IN LPP - YouTube

If $a_{rj} \geq 0$ for all nonbasic x_j , the problem has no feasible solution. To start the LP optimal and infeasible, two requirements must be met: 1. The objective function must satisfy the optimality condition of the regular simplex method (Chapter 3). 2. All the constraints must be of the type ($\leq$).

...

The Simplex method for maximizing the objective function starts at a basic feasible solution for the equivalent model and moves to an adjacent basic feasible solution that does not decrease the value of the objective function. If such a solution does not exist, an optimal solution for the equivalent model has been reached.

...

The simplex method provides a systematic algorithm which consist of moving from one basic feasible solution to another in a prescribed manner such that the value of the objective function is improved. The procedure of jumping from vertex to the vertex is repeated. The simplex algorithm is an iterative procedure for solving LP problems.

• If a sequence of pivots starting from some basic feasible solution ends up at the exact same basic feasible solution, then we refer to this as “cycling.” If the simplex method cycles, it can cycle forever. • Klee and Minty [1972] gave an example in which the simplex algorithm really does cycle. Here is their example, with the pivot ...

Tutorial 7: Degeneracy in linear programming

Solve the given linear programming problem using the simplex method. If no optimal solution exists, indicate whether the feasible region is empty or the objective function is unbounded. (Enter EMPTY if the feasible region is empty and UNBOUNDED if the objective function is unbounded.)

Answered: Solve the given linear programming... | bartleby

As mentioned above, the simplex method progresses through a series of adjacent extreme points (basic feasible solutions) with increasing values of the objective function. Each such point can be represented by a simplex tableau, a table storing the information about the basic feasible solution corresponding to the extreme point.

The Simplex Method

Simplex Method Step 1 : Determine a starting basic feasible solution. Step 2 : Determine the entering basic variable by selecting the non-basic variable with the most negative value (in case of maximization) or with the most positive (in case of minimization) in the Z-row. Stop if there is no entering variable, the last solution is optimal.

If the system $Ax = b$ has no solution linear program has no feasible solution either. If some row of A is a linear combination of the other rows, then the corresponding equation is redundant and it can be deleted from the system without changing the set of equations.

In mathematical optimization, Dantzig's simplex algorithm is a popular algorithm for linear programming. The name of the algorithm is derived from the concept of a simplex and was suggested by T. S. Motzkin. Simplices are not actually used in the method, but one interpretation of it is that it operates on simplicial cones, and these become proper simplices with an additional constraint. The simplicial cones in question are the corners of a geometric object called a polytope. The shape of this po

Perform dual simplex methods to obtain a basic solution which is both primal feasible (all basic variables within bounds) and dual feasible (all reduced costs have the desired sign.) This solution is optimal for the phase I problem. Replace the modified phase I objective function with the original objective function.
