No Feasible Solution

No Feasible Solution: Simplex Method. If in course of simplex method computation, one or more artificial variables remain in the basis at positive level at the end of phase 1 computation, the problem has no feasible solution (Infeasible Solution). For example, let us consider the following linear program problem (LPP).

No Feasible Solution Example: Simplex Method

Show that it has no feasible solution using SIMPLEX METHOD. It seems very logical that it has no feasible solution(how can a value be less than \$0.6\$ and greater than \$2\$ at the same time). When I tried solving it using simplex method, I found that it has an unbounded solution(as corresponding to the maximum(positive) value of \$c_j - z_j \$, all values in the corresponding column were either negative or zero).

linear programming - Show that it has no feasible solution ...

If you are using the Simplex LP Solving method, and the model is well scaled, Solver has determined for certain that there is no feasible solution. If you are using the GRG Nonlinear Solving method, this method (which always starts from the initial values of the variables) was unable to find a feasible solution; but there could be a feasible solution far away from these initial values, which Solver might find if you run it with different initial values for the variables.

Infeasible models A linear program is infeasible if there exists no solution that satisfies all of the constraints -- in other words, if no feasible solution can be constructed. Since any real operation that you are modelling must remain within the constraints of reality, infeasibility most often indicates an error of some kind.

Infeasible models

The feasible solution refers to the set of values applicable for the decision variable. It satisfies the entire constraints provided in the optimization problem. The feasible region of the optimization problem is defined by all the set of the feasible solutions. In most of the optimization algorithms first, an attempt is made to find the feasible solution and then another attempt is made to locate another feasible solution which will improve the objective function value.

No feasible set. If the constraints of an optimization problem are mutually contradictory, there are no points that satisfy all the constraints and thus the feasible region is the null set. In this case the problem has no solution and is said to be infeasible .

Feasible region - Wikipedia

In the theory of linear programming, a basic feasible solution is a solution with a minimal set of non-zero variables. Geometrically, each BFS corresponds to a corner of the polyhedron of feasible solutions. If there exists an optimal solution, then there exists an optimal BFS. Hence, to find an optimal solution, it is sufficient to consider the BFS-s. This fact is used by the simplex algorithm, which essentially travels from some BFS to another until an optimal one is found.

basic feasible solution: put the slack variables on the left hand side. How-ever, this is not always the case, especially for minimization problems, or problems with equality constraints in the original model. Consider the following simple LP. minimize x s.t $x \geq 5$ $x \geq 0$ Forget for a minute that the solution is obvious. If we try to use simplex,

Finding feasible solutions to a LP

Alternative optimal solutions occur when there is no feasible solution to the problem. F A range of optimality is applicable only if the other coefficient remains at its original value.

In the feasibility check, Darwin Designer tries all the largest available pipe sizes to see if it can meet the constraints, and if it cannot, it determines that there is no feasible solution. To check this, go to the time step in question (8.00 hrs using the example) in model and check the results for pressures and pipe headloss.

Alternatively, an LP is infeasible if there exist no solution that satisfies all of the constraints. Hence, if no feasible solution can be constructed, then the LP is infeasible. Note that a real operation must remain within the constraints of reality; hence, infeasibility most often indicates an error of some kind.

Feasible and infeasible solution in linear programming ...

Solution:Notice that the feasible set is unbounded. This means that there may or may not be an optimal solution which results in a maximum or minimum function value. The vertices (corner points) of the feasible set are (0, 7), (4, 2), and (8, 0). We substitute each corner point into the objective function, as shown in the chart below.

Section 2.1 - Solving Linear Programming Problems

A local optimal solution is one where there is no other feasible solution "in the vicinity" with a better objective function value. Frontline's Solver products are designed to find global optimum solutions -- but this is not always possible.
