Concepts of Biology

Concepts of Biology is designed for the single-semester introduction to biology course for non-science majors, which for many students is their only college-level science course. As such, this course represents an important opportunity for students to develop the necessary knowledge, tools, and skills to make informed decisions as they continue with their lives. Rather than being mired down with facts and vocabulary, the typical non-science major student needs information presented in a way that is easy to read and understand. Even more importantly, the content should be meaningful. Students do much better when they understand why biology is relevant to their everyday lives. For these reasons, Concepts of Biology is grounded on an evolutionary basis and includes exciting features that highlight careers in the biological sciences and everyday applications of the concepts at hand. A Framework for K-12 Science Education

Practices, Crosscutting Concepts, and Core Ideas *National Academies Press*

Science, engineering, and technology permeate nearly every facet of modern life and hold the key to solving many of humanity's most pressing current and future challenges. The United States' position in the global economy is declining, in part because U.S. workers lack fundamental knowledge in these fields. To address the critical issues of U.S. competitiveness and to better prepare the workforce, A Framework for K-12 Science Education proposes a new approach to K-12 science education that will capture students' interest and provide them with the necessary foundational knowledge in the field. A Framework for K-12 Science Education outlines a broad set of expectations for students in science and engineering in grades K-12. These expectations will inform the development of new standards for K-12 science education and, subsequently, revisions to curriculum, instruction, assessment, and professional development for educators. This book identifies three dimensions that convey the core ideas and practices around which science and engineering education in these grades should be built. These three dimensions are: crosscutting concepts that unify the study of science through their common application across science and engineering; scientific and engineering practices; and disciplinary core ideas in the physical sciences, life sciences, and earth and space sciences and for engineering, technology, and the applications of science. The overarching goal is for all high school graduates to have sufficient knowledge of science and engineering to engage in public discussions on science-related issues, be

careful consumers of scientific and technical information, and enter the careers of their choice. A Framework for K-12 Science Education is the first step in a process that can inform state-level decisions and achieve a research-grounded basis for improving science instruction and learning across the country. The book will guide standards developers, teachers, curriculum designers, assessment developers, state and district science administrators, and educators who teach science in informal environments.

Learning from Animations in Science Education

Innovating in Semiotic and Educational Research *Springer Nature*

This book examines educational semiotics and the representation of knowledge in school science. It discusses the strategic integration of animation in science education. It explores how learning through the creation of science animations takes place, as well as how animation can be used in assessing student's science learning. Science education animations are ubiquitous in a variety of different online sites, including perhaps the most popularly accessed YouTube site, and are also routinely included as digital augmentations to science textbooks. They are popular with students and teachers and are a prominent feature of contemporary science teaching. The proliferation of various kinds of science animations and the ready accessibility of sophisticated resources for creating them have emphasized the importance of research into various areas: the nature of the semiotic construction of knowledge in the animation design, the development of critical interpretation of available animations, the strategic selection and use of animations to optimize student learning, student creation of science animations, and using animation in assessing student

science learning. This book brings together new developments in these research agendas to further multidisciplinary perspectives on research to enhance the design and pedagogic use of animation in school science education. Polymer Gels

Fundamentals and Biomedical Applications *Springer Science & Business Media*

This volume contains a series of papers originally presented at the Symposium on Polymer Gels organized and sponsored by the Research Group on Polymer Gels, The Society of Polymer Science of Japan and co-sponsored by the Science and Technology Agency (ST A) and MIT!, Japan. The Symposium took place at Tsukuba Science City on 18th and 19th September, 1989. Recognized experts in their fields were invited to speak and there was a strong attendance from government, academic and industrial research centers. The purpose of the Symposium was to review the state of the art and to present and discuss recent progress in the understanding of the behavioral properties of polymer gels and their application to biomedical, environmental and robotic fields. Most of the papers and related discussions concentrated on the swelling behavior of hydrogels and chemomechanical systems, both artificial and naturally occurring, in which external stimuli of a physical or chemical nature control energy transformation or signal transduction. The recent great interest in chemomechanical systems based on polymer gels has stimulated considerable effort towards the development of new sensors and actuators, controllable membrane separation processes, and delivery systems in which the functions of sensing, processing and actuation are all built into the polymeric network device. Artificial chemomechanical systems, through the use of environmentally sensitive polymer gels, are emerging as interesting materials for mimicking basic processes previously only confined to the biological world, and commercially viable applications are also foreseen in the not-too-distant future.

Non-Natural Nucleotides as Modulators of ATPases

ATP is the chemical medium of energy transfer for all living organisms. A common assumption is that the active site of all ATP-binding proteins share similar architecture. This study challenges this assumption by using non-natural nucleotides as chemical probes for exploring the diverse architecture of the ATP binding site. Two systems were used to explore this principle; first was the sliding clamp loader ATPase which is responsible for processive DNA replication and second was the ATP binding cassette transporter P-glycoprotein (P-gp) that is involved in multidrug resistance (MDR) phenotype. A library of non-natural nucleotides was used to probe both the T4 bacteriophage and E.coli clamp loaders. One compound, 5-nitroindolyl 2'-deoxyribose triphosphate, was found to selectively inhibit the T4 bacteriophage clamp loader (gp44/62). Mutagenesis studies strongly suggest that specific electrostatic interactions between the nitro moiety and Arg175 of gp44/62 are responsible for the selectivity. Functionally, this inhibition was shown to inhibit processive DNA replication and effectively reduce T4 plaque formation over a lawn of E.coli. Several non-natural nucleosides were submitted to a screening service which identified 5-cyclohexyl 2'-deoxyriboside (d5-CHI) as a functional inhibitor of P-gp. From this screen we hypothesized that d5-CHI acts as an ATP competitive inhibitor, however, this compound was shown to be a non-transportable substrate of P-glycoprotein that is able to stimulate its ATPase activity and influence the drug stimulated ATPase catalytic efficiency (V_{max}/K_m) of other important chemotherapeutic drugs. The effects of d5-CHI on drug stimulated P-gp ATPase catalytic efficiency was shown to be in direct correlation with changes in P-gp mediated drug resistance in a P-gp overexpressing MDR cell line. Although the results of this study were contrary to the original hypothesis, d5-CHI proved to be a useful tool for developing a

diagnostic method for determining P-gp mediated drug interactions using ATPase activity. This study also demonstrated a unique selectivity of P-gp for its substrates as structurally similar compounds such as 5-cyclohexeneindolyl 2'-deoxyriboside and 5-phenylindolyl 2'-deoxyriboside failed to illicit any interactions with P-gp. Overall, these studies demonstrate the diverse architecture of ATPases and the use of non-natural nucleotides as chemical probes for understanding protein function.

This volume contains papers based on the workshop OC Energy and Information Transfer in Biological Systems: How Physics Could Enrich Biological Understanding OCO, held in Italy in 2002. The meeting was a forum aimed at evaluating the potential and outlooks of a modern physics approach to understanding and describing biological processes, especially regarding the transition from the microscopic chemical scenario to the macroscopic functional configurations of living matter. In this frame some leading researchers presented and discussed several basic topics, such as the photon interaction with biological systems also from the viewpoint of photon information processes and of possible applications; the influence of electromagnetic fields on the self-organization of biosystems including the nonlinear mechanism for energy transfer and storage; and the influence of the structure of water on the properties of biological matter."

Regulation of Tissue Oxygenation, Second Edition *Biota Publishing*

This presentation describes various aspects of the regulation of tissue oxygenation, including the roles of the circulatory system, respiratory system, and blood, the carrier of oxygen within these components of the cardiorespiratory system. The respiratory system takes oxygen from the atmosphere and transports it by diffusion from the air in the alveoli to the blood flowing through the pulmonary capillaries. The cardiovascular system then moves the oxygenated blood from the heart to the microcirculation of the various organs by convection, where oxygen is released from hemoglobin in the red blood cells and moves to the parenchymal cells of each tissue by diffusion. Oxygen that has diffused into cells is then utilized in the mitochondria to produce adenosine

triphosphate (ATP), the energy currency of all cells. The mitochondria are able to produce ATP until the oxygen tension or PO_2 on the cell surface falls to a critical level of about 4–5 mm Hg. Thus, in order to meet the energetic needs of cells, it is important to maintain a continuous supply of oxygen to the mitochondria at or above the critical PO_2 . In order to accomplish this desired outcome, the cardiorespiratory system, including the blood, must be capable of regulation to ensure survival of all

tissues under a wide range of circumstances. The purpose of this presentation is to provide basic information about the operation and regulation of the cardiovascular and respiratory systems, as well as the properties of the blood and parenchymal cells, so that a fundamental understanding of the regulation of tissue oxygenation is achieved.
