Computational fluid dynamics (CFD) has made tremendous progress especially in aerodynamics and aircraft design over the past 20 years. An obvious question to ask is "why not use CFD methods to solve aeroacoustics problems?" Most aerodynamics problems are time independent, whereas aeroacoustics problems are, by definition, time dependent.

The second case considered here is a hypersonic flow over a $\alpha = 33^\circ$ compression ramp followed by an expansion corner with the same deflection angle (θ). The incoming flow corresponds to a turbulent boundary layer at Mach 7.2 with a thickness $\delta = 5$ mm. Based on the free-stream properties and the reference length δ , the incoming flow has a Reynolds number of $Re_\delta = 102,731$.
