Overview Of Liquid Penetrant Inspection

The principle of liquid penetrant testing is that the liquid penetrant is drawn into the surface-breaking crack by capillary action and excess surface penetrant is then removed; a developer (typically a dry powder) is then applied to the surface, to draw out the penetrant in the crack and produce a surface indication.

The inspection with penetrant liquids, also referred to as dye penetrant inspection, or simply called penetrant testing, is a NDT method widely used to locate surface-breaking defects in all nonporous materials (metals, plastics or ceramics). Basically, a low surface tension fluid, which may or may not be fluorescent, depending on the type of dye used, is applied on the surface of the tested component by dipping, spraying or brushing it.

Liquid penetrant exams check for material flaws open to the surface by flowing very thin liquid into the flaw and then drawing

the liquid out with a chalk-like developer. Welds are the most common item inspected, but plate, bars, pipes, castings, and forgings are also commonly inspected using liquid penetrant examination.

Liquid Penetrant Examination

For surface examination, liquid penetrant testing (PT) is the traditional method and, in practice, the main method employed. Improved detection sensitivity is normally achieved with magnetic particle inspection (MPI), but this method can only be applied on magnetic materials.

Dye penetrant inspection (DP), also called liquid penetrate inspection (LPI) or penetrant testing (PT), is a widely applied and low-cost inspection method used to check surface-breaking defects in all non-porous materials (metals, plastics, or ceramics).

Dye penetrant inspection - Wikipedia

Liquid penetrant testing is used to inspect large areas very efficiently and will work on most nonporous materials. Used to inspect ferromagnetic materials (those that can be magnetized)

for defects that result in a transition in the magnetic permeability of a material.

NDT Method Summary

4.1 A liquid penetrant which may be a visible or a fluorescent material is applied evenly over the surface being examined and allowed to enter open discontinuities. After a suitable dwell time, the excess surface penetrant is removed. A developer is applied to draw the entrapped penetrant out of the discontinuity and stain the developer.

Dye Penetrant Inspection Procedure

Liquid penetrant inspection is limited to surface defects by capillary action. It is not an appropriate method for porous materials or the detection of subsurface defects. The method is simple. First, the material is prepared by proper cleaning and degreasing.

Liquid Penetrant Testing | Magnaflux

Liquid Penetrant Inspection uses the property of capillary action to find surface breaking discontinuities in a variety of materials. It is one of the most economical NDT methods. A low viscosity liquid (penetrant) is applied to the surface of a test piece. Liquid Penetrant Inspection uses this capillary action to allow the penetrant to enter into fissures and voids that are open to the surface.
