The purpose of the lab was to find which metal is the most reactive and which metal is the least reactive. It was known before the experiment that the metals used in the experiment are placed in the activity series from most active to least active as follows: magnesium, aluminum, zinc, and copper. The hypotheses formed were that zinc nitrate would react with aluminum and magnesium; aluminum nitrate would react with magnesium; copper nitrate

When an atom gains electrons, it is reduced. Metals higher on the activity series are more likely to react relative to those lower on the activity series. The activity series can be used to predict products of reactions, and to predict if a reaction will even occur. In this experiment, different metals were tested for their reactivity. It was recorded if a reaction occurred or not, so that an activity series could be created. Data & Results

the more reactive nonmetals will

displace ions of the less reactive halides from solution. In an activity series of nonmetals, the most reactive halogen is the one most easily reduced. The first part of this experiment derives an activity series for metals and uses a microscale technique. The second part derives an activity series for halogens.
