An Introduction to Bicomponent Fibers - Hills, Inc.

A bicomponent fiber is

made of two materials,

utilizing desired

properties of each

material. Such fibers can be created by extrusion spinning. One or both materials may remain in the finished product, or one material may be dissolved, leaving only one material remaining. For example, DuPont created the highly coiled elastic fiber called cantrese having two different nylon polymers side-by-side.

Bicomponent fiber - Wikipedia

A bicomponent fiber is spun from two or more polymers extruded from one spinneret to form a single fiber. Typical bicomponent cross sections are core-sheath, side-by-side, and multiple core configurations. Core-sheath types are commonly used as binder fibers for

nonwovens, side-by-side to design self-crimping yarns, and multiple cores to produce microfibers.

INTRODUCTION TO BICOMPONENT YARNS. Bicomponent yarns describe filament yarns which consist of two different polymers. Those polymers can be embedded in various ways: for example by the core / sheath combination or side by side as pictured below: Thanks to this combination of polymers, bicomponent yarns have the properties of both polymers, enabling them to be applied in a range of applications like adhesion melting.

Bicomponent Fibers and its Applications

The term bicomponent fiber, also known as a conjugate fiber, refers to a single fiber that includes two varied polymer components inside the same filament. The production of bicomponent fibers is not a new concept -

Dupont already introduced this idea in the mid 1960s. However, the processes used to produce bicomponent fibers were not streamlined, which recently led to the development of new material systems and their manufacturing technologies.

For the bicomponent fibers, the mean polymer density ρ^- , i.e. the quotient of the sum of the partial masses of core and sheath (m_c and m_s) and the total volume V_{tot} , was calculated according to the following equation: (1)

$$\rho^- = \frac{m_c + m_s}{V_{tot}} = \frac{\rho_c * V_c + \rho_s * V_s}{V_c + V_s} = \rho_c * \frac{V_c}{V_c + V_s} + \rho_s * \frac{V_s}{V_c + V_s}$$
