A Novel Method for Analyzing Sequential Eye Movements Reveals the Relationship Between Learning and Strategy on Raven's Advanced Progressive Matrices

Abstract: Eye-movement patterns contain important information about strategic information processing. Using the successor representation to capture statistical regularities in temporally extended fixation sequences it was possible to assess strategic shifts in eye-movement patterns and predict scores on Ravens Advanced Progressive Matrices (APM) test. Thirty-five participants completed two subsets of APM items on two separate days. Principal component analysis of the SRs revealed individual differences in scanning patterns. The strongest principal component quantified the tendency to scan the Raven matrix systematically; another component quantified the tendency to toggle to and from the response area. These two components predicted 56% of the variance in Raven scores. The difference in SRs also suggested that the learning effect on Raven may be due to increases in systematicity. Thus, the systematicity of eye movements is an important new strategic index on Raven that can be revealed by successor-representation analysis.

Computational Approaches to Analogical Reasoning: Current Trends *Springer*

Analogical reasoning is known as a powerful mode for drawing plausible conclusions and solving problems. It has been the topic of a huge number of works by philosophers, anthropologists, linguists, psychologists, and computer scientists. As such, it has been early studied in artificial intelligence, with a particular renewal of interest in the last decade. The present volume provides a structured view of current research trends on computational approaches to analogical reasoning. It starts with an overview of the field, with an extensive bibliography. The 14 collected contributions cover a large scope of issues. First, the use of analogical proportions and analogies is explained and discussed in various natural language processing problems, as well as in automated deduction. Then, different formal frameworks for handling analogies are presented, dealing with case-based reasoning, heuristic-driven theory projection, commonsense reasoning about incomplete rule bases, logical proportions induced by similarity and dissimilarity indicators, and analogical proportions in lattice structures. Lastly, the volume reports case studies and discussions about the use of similarity judgments and the process of analogy making, at work in IQ tests, creativity or other cognitive tasks. This volume gathers fully revised and expanded versions of papers presented at an international workshop, as well as invited contributions. All chapters have benefited of a thorough peer review process.

Introduction to Psychological Assessment in the South African Context

Experimental Psychology With Advanced Experiments (in 2 Vols.) *Concept Publishing Company*

Human Assessment and Cultural Factors *Springer Science & Business Media*

Against the background of NATO's Istanbul conference of 1971 (Cronbach and Drenth, 1972), the Kingston conference shows that great progress has been made by the community of cross-cultural psychologists. The progress is as much in the psychology of the investigators as in the investigations being reported. In 1971 the investigators were mostly strangers to each other. Behind their reports lay radically different field experiences, disparate research traditions, and mutually contradictory social ideals. Istanbul was not a Tower of Babel, but participants did speak past each other. Now a community exists, thanks to the meetings of NATO and the International Association for Cross-Cultural Psychology, to flourishing journals, and the Triandis et al. (1980) Handbook. The members tend to know each other, can anticipate how their formulations will fall on the ears of others, and accept superficially divergent approaches as making up a collective enterprise. Ten years ago there was open conflict between those who confronted exotic peoples with traditional tests and applied traditional interpretations to the responses, and the relativists who insisted that tasks, test taking, and interpretation cannot be "standardized" in the ways that matter. Today's investigators are conscious of the need to revalidate tasks carried into alien settings; they often prefer to redesign the mode of presentation and to attune the subject to test taking. They face the difficulties squarely and recognize that even the best means of coping are only partially successful.

Uses and Abuses of Intelligence

Studies Advancing Spearman and Raven's Quest for Non-arbitrary Metrics

Interactive Assessment *Springer Science & Business Media*

The terms interactive and dynamic would never have been associated with psychological and psychoeducational assessment a generation ago. They

have currency now because of widespread dissatisfaction with the normative, standardized testing model, criticism of theoretical concepts of intelligence, recognition of abuses of standardized intelligence testing, and frustration with prediction and classification as primary goals of assessment. It is almost certainly true that public policy concerns propel scientific activity far more often than science propels public policy! In the case of psychological assessment, public policy concerns have arisen in the last 20 years primarily around issues of possible "discrimination" against members of ethnic minorities. At the same time, there has been a re surge of dedication to "excellence in education" goals. These concerns have led to such extreme measures as prohibition of the use of standard ized intelligence tests to determine school placement decisions, especially for minority children. They have led also to a search for alternatives to standardized, normative testing. The chapters in this volume represent a variety of answers to this need.

An introduction that sets an historical and philosophical context, and two essays that interrelate the contributions, complete the volume.

Human Computation *Morgan & Claypool Publishers*

Human computation is a new and evolving research area that centers around harnessing human intelligence to solve computational problems that are beyond the scope of existing Artificial Intelligence (AI) algorithms. With the growth of the Web, human computation systems can now leverage the abilities of an unprecedented number of people via the Web to perform complex computation. There are various genres of human computation applications that exist today. Games with a purpose (e.g., the ESP Game) specifically target online gamers who generate useful data (e.g., image tags) while playing an enjoyable game. Crowdsourcing marketplaces (e.g., Amazon Mechanical Turk) are human computation systems that coordinate workers to perform tasks in exchange for monetary rewards. In identity verification tasks, users perform computation in order to gain access to some online content; an example is reCAPTCHA, which leverages millions of users who solve CAPTCHAs every day to correct words in books that optical character recognition (OCR) programs fail to recognize with certainty. This book is aimed at achieving four goals: (1) defining human computation as a research area; (2) providing a comprehensive review of existing work; (3) drawing connections to a wide variety of disciplines, including AI, Machine Learning, HCI, Mechanism/Market Design and Psychology, and capturing their unique perspectives on the core research questions in human computation; and (4) suggesting promising research directions for the future. Aptitude for Interpreting *John Benjamins Publishing Company*

First published as a Special Issue of Interpreting (issue 10:1, 2011) and complemented with two articles published in Interpreting issue 16:1, 2014, this volume provides a comprehensive view of the challenge of identifying and measuring aptitude for interpreting. Following a broad review of the existing literature, the array of eight empirical papers captures the multiple dimensions of aptitude, from personality traits and soft skills such as motivation, anxiety and learning styles to aspects of cognitive performance. The populations studied, with experimental as well as survey research designs, include students and professionals of sign language interpreting as well as spoken-language interpreting, and valuable synergies emerge. While pointing to the need for much further work, the papers brought together in this volume clearly represent the cutting edge of research into aptitude for interpreting, and should prove a milestone on the way toward supplying educators with reliable methods for testing applicants to interpreter training programs.

Behavior Genetics of Cognition Across the Lifespan *Springer Science & Business Media*

Along with psychopathology, cognition has been one of the primary phenotypic focal points of the field of behavior genetics since its inception. Francis Galton's 1874 examination of eminent families in Britain was among the earliest attempts to investigate whether cognitive achievements run in families. This volume presents current methodologies for understanding cognitive abilities that move beyond the outdated nature vs. nurture paradigm. Recent advances in both collection and statistical modeling of twin data, particularly longitudinal twin data, make this an especially advantageous moment to produce a work that presents a collection of the groundbreaking research on cognitive abilities across the lifespan. This

volume presents an overview of the current state of quantitative and molecular genetic investigations into the many facets of cognitive performance and functioning across the lifespan.
