Netezza User Defined Functions Developer

Debug user-defined functions and aggregates This section describes how to debug and test user-defined functions, aggregates, and shared libraries by using two debugging aids: message logging and UDX test harness. This section also describes how to disable UDXs within your nzsqli session so that you can troubleshoot problems such as changes in query

performance on the IBM Netezza system. Create memory workpads by using the SPUPad This section describes the SPUPad feature, which allows UDX ...

IBM Netezza user-defined functions

This section provides reference information for the Netezza Performance Server SQL commands that relate to the creation and management of user-defined functions and aggregates. Data type helper API reference This section describes helper functions that you can use to manage, verify, and convert Netezza Performance Server-specific data type values. There are helper functions available for processing two types of data types: temporal (date/time) values and numeric values.

Netezza Performance Server user-defined functions

The Netezza system also supports the development and use of user-defined functions and aggregates. This feature is described in the IBM Netezza User-Defined Functions Developer's Guide, which is available from Netezza for users who are participating in the Netezza Developer Network.

Netezza SQL analytic functions - IBM

Netezza User Defined Functions (UDFs) A user-defined function (UDF) is user code that is executed by the Netezza system in response to SQL invocation syntax. User code is specific set of codes that are written to perform the particular functions that Netezza Built-in functions such as upper(), sqr(), or length() cannot perform. A user-defined function is a scalar function; that is, it returns one value.
