Probability Theory and Statistics

After you see that you have a single Ace, the probability goes up: the previous answer

needs to be divided by the probability that you get a single Ace, which is $13\phi(39\ 3) (52\ 4) \dots 0:4388$. The answer then becomes $134\ 13\phi(39\ 3) \dots 0:2404$. Here is how you can quickly estimate the second probability during a card game: give the

Lecture Notes for Introductory Probability

In the first lecture of this week, we will conclude the probabilistic part of the module with some estimates of probabilities, the Law of Large Numbers and the Central Limit Theorem. In the second and third lecture of the week, we will introduce the statistical part of the module. We will cover the concept of a random sample.

To obtain a sum of 10 or more, the possibilities for the two numbers are (4,6), (5,5), (6,4), (5,6), (6,5) or (6,6). So the probability of the event is $6/36 = 1/6$. Example A box contains 20 balls, of which 10 are red and 10 are blue. We draw ten balls from the box, and we are interested in the event that exactly 5 of the balls are red and 5

are blue.
