given by an empirical formula $F_{rr} = a + bV + cV^2$ where the dependency of constants a , b & c are constants, V is speed in Km/h and F_{rr} is train resistance in Kg/Tonne. Constant factors a , b and c accounts for the entire possible variable which has its role in the running resistance having bearing on weight alone or weight & speed both.

The additional tunnel resistance for single-track tunnels in the Norwegian high speed rail assessment study has been used to estimate travel times through tunnels in corridor west (SWECO, 2011) and to estimate the additional energy consumption running in tunnels (Dobeschinsky et al., 2011, Asplan Viak, 2011). It should be noted that these resistance predictions encompass higher velocities than observed in this work (up to 330 km/h), but since the predictions are velocity-dependent they are ...

Maglev (derived from magnetic levitation) is a system of train transportation that uses two sets of magnets: one set to repel and push the train up off

the track, and another set to move the elevated train ahead, taking advantage of the lack of friction. Along certain "medium-range" routes (usually 320 to 640 km [200 to 400 mi]), maglev can compete favourably with high-speed rail and airplanes.

Typically this resistance was influenced by the cross sectional area of the train and its speed. At high speeds air resistance became especially important as it was based upon the square of the speed. iv) Flange resistance - Rolling friction between wheel and rail. This can be considered a constant for a given quality of track.

Baker notes that an $x\%$ reduction of a train's aerodynamic drag can reduce fuel consumption by $0.5x\%$ [9]. Therefore, the aerodynamic drag of the train is the main method for reducing the overall resistance and energy consumption of high-speed trains [10]. The train aerodynamic drag consists of pressure drag and viscous drag.
