Introduction. The theory presented in this book explains in a consistent manner all dynamic effects (diffusion, neutron scattering, viscoelasticity, optical birefringence) observed in very concentrated solutions and melts of linear polymers from a macromolecular point of view. This monograph reconciles different approaches to polymer dynamics and reflects the modern situation in understanding the relaxation behaviour of the polymer systems.

Polymers have entered the life of the twentieth century as irreplaceable construction materials. Polymers differ from other substances by the size of their molecules which, appropriately enough, are referred to as macromolecules, since they consist of thousands or tens of thousands of atoms (molecular weight up to 10^6 or more) and have a macroscopic rectilinear length (up to 10 cm).

The Mesoscopic Theory of Polymer Dynamics: 95: Pokrovskii ...

Theory and mechanism. Reptation theory describes the effect of polymer chain entanglements on the relationship between molecular mass and chain relaxation time (or similarly, the polymer's zero-shear viscosity). The theory predicts that, in entangled systems, the relaxation time τ is proportional

to the cube of molecular mass, M : $\tau \sim M^3$. This is a reasonable approximation of the actual ...
