I often get asked how to fit different multilevel models (or individual growth models, hierarchical linear models or linear mixed-models, etc.) in R. In this guide I have compiled some of the more common and/or useful models (at least common in clinical psychology), and how to fit them using `nlme::lme()` and `lme4::lmer()`. I will cover the common two-level random intercept-slope model, and three-level models when subjects are clustered due to some higher level grouping (such as therapists ...

Getting started with multilevel modeling in R is simple. lme4 is the canonical

package for implementing multilevel models in R, though there are a number of packages that depend on and enhance its feature set, including Bayesian extensions. lme4 has been recently rewritten to improve speed and to incorporate a C++ codebase, and as such the features of the package are somewhat in flux.

Getting Started with Mixed Effect Models in R — Jared Knowles

In a multilevel (random effects) model, the effects of both types of variable can be estimated. Inference to a population of groups: In a multilevel model the groups in the sample are treated as a random sample from a population of groups. Using a fixed effects model, inferences cannot be made beyond the

groups in the sample. An example
